# Recycling

Recycling is a way to protect the planet. With the recycled materials, new materials are manufactured using less natural resources. From the waste we produce, objects such as paper, plastic, glass and some metals, can be recycled.

It is important to properly separate materials for recycling and deposit them in the appropriate recycling container. For example, newspapers and cardboard go in the container for papers; plastic bottles and plastic containers and cans go in the plastics container; and bottles and glass jars go in the container for glass.

**1. Color the objects that can be recycled. Write from which material they are made.**

**2. Put each object in the recycling bin. Deposit them using arrows.**
